Tutorial 1Pb-6

There are total 14 players

Number of bowlers = 5

Remaining players = $14 - 5 = 9$

Number of ways to select 11 players such that there are atleast 3 bowlers.

Therefore, there are 3 possibilities

(1) team with 3 bowlers.

(2) team with 4 bowlers.

(3) team with 5 bowlers.

Case 1: No. of ways = ${}^5C_3 \cdot {}^9C_8$ Case 2: No. of ways = ${}^5C_4 \cdot {}^9C_7$ Case 3: No. of ways = ${}^5C_5 \cdot {}^9C_6$ \therefore Total number of ways = case 1 + case 2 + case 3

$$\# = {}^5C_3 \cdot {}^9C_8 + {}^5C_4 \cdot {}^9C_7 + {}^5C_5 \cdot {}^9C_6$$

$$\therefore \# = 90 + 180 + 84$$

= 354 total number of ways of selecting 11 players given the req. conditions.

Pb 8 There are total 10 points in a plane.

If all the 10 points are non-collinear

$$\therefore \text{Total number of lines} = {}^{10}C_2 \quad \text{--- (1)}$$

It is given that out of 10 points, 4 points are collinear

$$\text{Number of lines formed using these 4 collinear points} = {}^4C_2 \quad \text{--- (2)}$$

However ~~#~~ these ~~4~~ ~~5~~ points results in the same line

$$\therefore \text{Total number of lines} = {}^{10}C_2 - {}^4C_2 + 1$$

$$\therefore \text{Total number of lines} = 45 - 6 + 1$$

$$\therefore \text{Total number of lines} = 40$$

Pb-9 Set given $\{0, 1, 2, 3, 4, 5\}$

We have to form a 4-digit number
(repetition of digit is not allowed).

1. For the first digit we have 5 options
(0 not included)
2. For the 2nd digit, since repetition not allowed, and it can be 0, so 5 options
3. For the 3rd and 4th digit we have 4 and 3 options respectively.

\therefore 4-digit ^{different} numbers that can be formed

$$= 5 \times 5 \times 4 \times 3$$

$$= \underline{\underline{300}}$$
